Quantum Theory of Charge Transfer Processes in Condensed

Abstract. There exist a large variety of phenomena in condensed media (liquids and solids) that are interpreted as charge-transfer processes involving the transition of a single electron, proton, or ion from one atom or atomic group to another.

Reference system master equation approaches to condensed

Two complimentary master equation approaches for the study of condensed phase charge transfer processes are developed. The first approach is appropriate when the (diabatic) activation energy is larger than the electronic coupling strength, and thus localized tight binding states form a zeroth-order set of electronic states.

Coherence transfer processes in vibrational relaxation of

The vibrational relaxation of a polyatomic molecule in a condensed host is studied by a consideration of two molecular vibrations. Relaxation processes, intermode coupling terms and vibrational frequency fluctuation contributions are retained.

Kinetics and mechanisms of charge transfer processes in

Charge carrier transfer processes are very important and play a vital role in photocatalytic reactions. A fundamental understanding of the kinetics and mechanisms of these charge transfer processes is crucial from the viewpoint of developing efficient photocatalysis systems for large-scale industrialization.
