Introduction. The fractional quantum Hall effect (FQHE) is a collective behaviour in a two-dimensional system of electrons. In particular magnetic fields, the electron gas condenses into a remarkable liquid state, which is very delicate, requiring high quality material with a low carrier concentration, and extremely low temperatures.

Each such liquid is characterized by a fractional quantum number that is directly observable in a simple electrical measurement. This article attempts to convey the qualitative essence of this still unfolding phenomenon, known as the fractional quantum Hall effect.

Fractional quantum Hall effect in optical lattices volume, and the realization of the fractional quantum Hall effect in optical lattices could therefore lead to a much higher energy gap and be much more robust. In a recent paper <sup>10</sup>, it was shown that it is indeed possible to realize the fractional quantum Hall effect in an optical lattice and that the energy gap achieved in this

The fractional quantum Hall effect (FQHE) was discovered in 1982. FQHE has almost the same characteristic as the QHE, with the Hall resistance quantized as  $h/e^2$  over a fraction. The first fraction

Abstract: We analyze a recently proposed method to create fractional quantum Hall (FQH) states of atoms confined in optical lattices [A. Sørensen et al., Phys. Rev. Lett. 94 086803 (2005)]. Extending the previous work, we investigate conditions under which the FQH effect can be achieved for bosons on a lattice with an effective magnetic field and finite onsite interaction

It is well known that the topological phenomena with fractional excitations, the fractional quantum Hall effect, will emerge when electrons move in Landau levels.

## **What causes the fractional quantum Hall effect Quora**

I'm quite sure the other answer is wrong. In his Nobel Lecture on the subject (Page on nobelprize.org), Horst Stormer does not state that quarks are responsible for the Fractional Quantum Hall Effect (FQHE).

### **Fractional Quantum Hall Effect in Optical Lattices**

The fractional quantum Hall effect occurs for electrons confined in a two dimensional plane under the presence of a perpendicular strong magnetic field. If  $N$  is the number of electrons in the system and  $N_f$  is the number of magnetic fluxes measured in units of the quantum magnetic flux  $\Phi_0 = h/e$ , then depending on the filling factor  $\nu = N/N_f$  the ground state of the system can form
